

1,4-Dioxane in Finished Products

1,4-Dioxane in Finished Products

Everything You Need to Know About the Newest Regulations

Manufacturers in the household cleaning, personal care, and cosmetic markets need to start reformulating their products to comply with upcoming 1,4-Dioxane regulations in New York state and Tilley Company is here to help.

What is 1,4-Dioxane?

1,4-Dioxane is a suspected carcinogen that's often present in dish soaps, hand and body soaps, and hair toners and astringents. Common sources include:

- › Sodium alkyl ether sulfates
- › Glycol distearates
- › PEGs
- › Ethoxylated alcohols/oils

What Are the New Regulations?

New York State signed into law a regulation that limits the amount of 1,4-Dioxane that can be found in finished products. Those limits for household cleaning, personal care and cosmetic products need to be in compliance by Dec. 31, 2022.

Tilley Company's technical team can help you learn more about these limitations and what they mean for your products.

How Tilley Company Can Help

It's critical for manufacturers to start evaluating their products as more states, including California, are looking at similar 1,4-Dioxane regulations.

Tilley's technical development team can reformulate products with new ingredients that reduce the level of 1,4-Dioxane in them, while maintaining performance.

Contact your Tilley Company Account Manager today to start this process.
